

ELIAI™ · THE AGENTIC FINANCE OS

Capital moves on evidence.

Underwriting, valuing and servicing illiquid claims. One edition in market.

EliAI™ is the Agentic Finance Operating System for the desks that commit capital against evidence somebody has to read. It reads the whole file with four reasoning specialists, sources every number it produces to the comparable that produced it, and refuses to price what the evidence will not carry. The AI reasons; the underwriter decides.

01

MRF Edition

Medical Receivables Finance, in market at eligrid.ai. Underwrite, perfect, service and realise receivables secured by liens against personal-injury and workers-compensation matters.

02

The Reasoning Desk

Chiron on the medicine, Justine on the law, Issac on the counterparty, Eli on the capital. Attribution is enforced per finding; a conclusion outside a specialist's axes is quarantined.

03

Disagreement Is Signal

When specialists disagree it is named and attributed, and it widens the band rather than being averaged away. Two extremes and four neutrals must not produce the same confidence.

04

It Refuses To Price

A cohort too thin to support a price yields a range, no midpoint, no recommended advance, and exclusion from book value rather than an assumed zero. Enforced in the schema.

05

Reproducible Marks

A valuation is an artifact: cohort, comparables, query, pinned engine version and seed. Marks are superseded, never overwritten, and the audit trail is hash-chained.

06

Controls In The Ledger

Funding checks the verified filing itself, not a nullable column. Evidence cannot pre-date the agreement permitting it. A concentration breach refuses at the moment of funding.

MRF EDITION,
AT ELIGRID.AI

ON THE ARCHITECTURE

Eve-Finance™ F5/reasoner — the Eve-Fusion™ instance calibrated to financial reasoning. Five cooperating models composed best-fit per request. Valuation is grounded in retrieval over comparable settled matters, never in training: the corpus is the model, so a mark can be re-derived years later. Multi-tenant isolation enforced by database policy on Eve-Grid™ Azure.

ON TRUST + COMPLIANCE

No certification is named on the eligrid.ai trust centre, and the page says why: a badge is the most common way a security page becomes untrue. Per-subject encryption makes erasure provable. Personal data is never used for training. Not investment advice; outputs are decision support and a qualified person remains responsible.
